## LEADING INNOVATION IN DETECTION OF POST-TRANSLATIONAL MODIFICATION

Epigenetic modulation of gene expression is one component of the proteostasis network, and is a focus of Enzo's development efforts supported by our expertise in post-translational modification biology and high-quality manufacturing of enzyme activity assays, biochemicals, antibodies, proteins, and peptide synthesis. Our epigenetics portfolio is focused on the enzymology of epigenetic regulation including HDACs, sirtuins, HATs, methyltransferases, and demethylases.

Our revolutionary FLUOR DE LYS<sup>®</sup> HDAC and Sirtuin assays allow simple, non-radioactive measurement of deacetylase activity amenable to automated platforms. These assays are founded upon an industry-leading portfolio of active enzymes and high purity peptide substrates to deliver the sensitivity needed when dissecting epigenetic pathways. We continue to provide innovative products, such as our CHEMILUM DE LYS<sup>®</sup> kit, which eliminates false data seen with other detection platforms.

In support of screening efforts, our chemists have curated the SCREEN-WELL<sup>®</sup> Epigenetics compound library, a collection of 43 biochemicals with defined activity against epigenetic regulating enzymes, each of which can be supplied individually upon request. Our portfolio of reagents also includes antibodies for the detection of key epigenetic-regulating enzymes and substrates, including modification-specific antibodies for acetylated, methylated, phosphorylated or ubiquitinated epitopes.

### Convenient Kits for Sample Conversion and Detection

DNA methylation can alter gene expression and cell differentiation, often resulting in unidirectional changes to genomic DNA. Because DNA methylation is involved in many processes, abnormalities in methylation patterns can lead to disease. Expanding our expertise in epigenetic modification analysis, Enzo Life Sciences offers a portfolio of products that enable detection of DNA methylation.

### High-efficiency Conversion of 5-mC and 5-hmC DNA for the Truest Downstream Analysis

- Conversion allows for resolution of single nucleotide information
- Kits provide high conversion rates without the introduction of DNA damage
- Converted output sample suitable for detection by bisulfite sequencing, methylation-specific PCR, high resolution melting curve analysis, microarray-based approaches, and next-generation sequencing

## HDAC AND SIRTUIN

### Convenient Screening Formats from the Pioneer in Non-radioactive HDAC and Sirtuin Assays

For over a decade, the FLUOR DE LYS<sup>®</sup> deacetylase assay platform has revolutionized assay of HDAC and Sirtuin enzyme activity, freeing researchers from cumbersome protocols required with radiolabeled or other modified histone-based methods. Our high quality assays utilize patented substrate/developer chemistry in combination with high-activity, high-purity enzymes, to deliver more high quality hits. Broad-class HDAC/Sirtuin screening assays are available in chemiluminescent, fluorescent, and colorimetric formats.

**2001**

The FLUOR DE LYS<sup>®</sup> platform revolutionized the assaying of HDAC and Sirtuin enzyme activity by freeing researchers from cumbersome protocols requiring radioactivity. With an expansive citation record, this is a robust high-throughput screening method for detection of HDAC and Sirtuin modulators.

**2002**

The COLOR DE LYS<sup>®</sup> assay was developed to meet our customers' demand for an easy-to-use, highly sensitive HDAC/SIRT assay that could be used on standard absorbance-based microplate readers.

**2012**

To answer the concern over false positives resulting from fluorescent substrates, Enzo developed the CHEMILUM DE LYS<sup>®</sup> HDAC/SIRT Drug Discovery Kit. This kit delivers superior signal-to-noise ratio, with no interference from cell extract detergents. Inhibitors for both Sirtuins and HDACs are included for added flexibility. No artifactual activation by resveratrol.

## Your Best Defense Against False Data

### CHEMILUM DE LYS® HDAC/SIRT Chemiluminescent Drug Discovery Kit

Traditional luciferase- and fluorescence-based screening assays for HDAC and Sirtuin activity are susceptible to the generation of false negatives or positives resulting from the effects of compound(s) being screened on elements of the reporter system (see table below). Based on our patent-pending CHEMILUM DE LYS® substrate and developer combination, the HDAC/SIRT Chemiluminescent Drug Discovery Kit provides a chemiluminescent alternative to radiolabeled and HPLC methods for HDAC activity. Discover the key advantages of this simple 3-step assay procedure designed to measure HDAC and Sirtuin activity in cellular or nuclear extracts, immunoprecipitates, or purified enzymes.

- High-specificity assay eliminates false positives or negatives (see table)
- Superior signal-to-noise ratio with no interference from cell extract detergents
- Consistent results from a validated system

#### Eliminate Interference Seen in Luciferase-based Assays

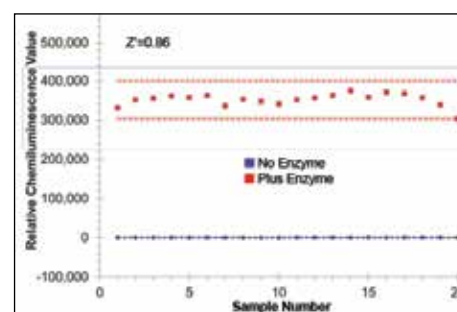

The compound, PTC124, is converted by luciferase in the presence of ATP to a high affinity multi-substrate adduct inhibitor, PTC124-AMP. PTC124 at concentrations greater than 1 μM inhibits the luciferase based assay, but has no effect on the CHEMILUM DE LYS® assay.

#### Minimize Interference from Lysis Detergents

The CHEMILUM DE LYS® assay was performed on HeLa nuclear extract, no enzyme or  $1.5 \times 10^5$  3T3 cells extracted with 0.1% CHAPS. The HDAC reaction was carried out with 25 μM CHEMILUM DE LYS® substrate for 1 hour at 37°C followed by trypsin treatment.

#### Powerful Reproducibility Ensures Consistent Results

Evaluation of Consistency by Z-factor Analysis. HeLa nuclear extract (4 μg) (red squares) or buffer (blue diamonds) was incubated for 2 hours at 24°C with 25 μM CHEMILUM DE LYS®. Reactions were stopped as described in the manual. Enhancer was added and chemiluminescence was read. Dashed lines indicate the 3x standard deviation range.

- Colorimetric readout at 405 nm compatible with most plate readers
- Resistant to detergent interference common to antibody-based assays
- Eliminates need for radioactivity, extractions, and/or chromatography
- Suitable for high-throughput analysis

#### Minimize Interference from Lysis Detergents

#### Our COLOR DE LYS® HDAC Colorimetric Assay is Less Sensitive to Detergents than Competitive Antibody-Based Assays.

HeLa nuclear extract (8.3 µg) was added to the substrate and buffer recommended by the manufacturer in the presence or absence of 0.1% Triton X-100®. After 1 hour at 37°C, the reaction was stopped and processed as recommended by the manufacturer.

Triton X-100® showed little or no effect on the COLOR DE LYS® reaction, but caused an apparent 70% inhibition of the antibody-based assay.

## High-throughput Assay for Detection of LSD1 Modulators

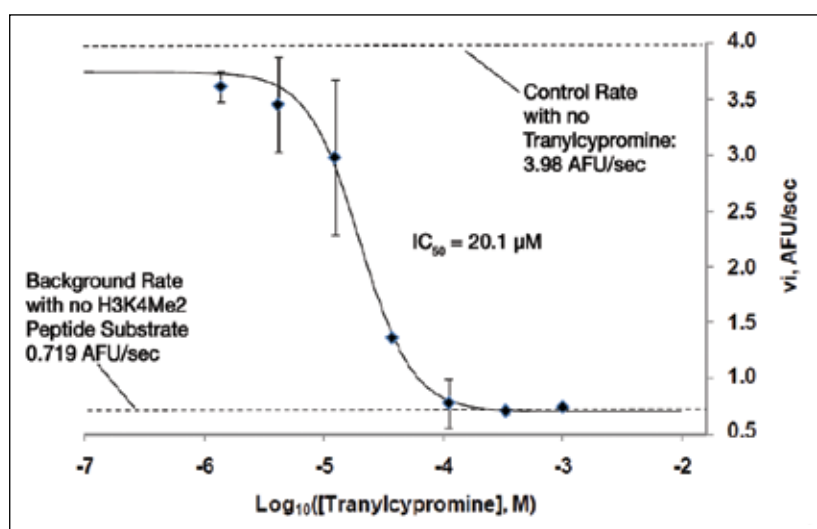

### LSD1 Fluorometric/Colorimetric Drug Discovery Kit

#### A CELLESTIAL® Red Hydrogen Peroxide Assay System

The LSD1 Fluorometric Drug Discovery Kit provides all necessary reagents for measuring human LSD1 activity in a sensitive, real-time fluorescent or colorimetric assay. LSD1 is inhibited by a number of established monoamine oxidase inhibitor drugs, including tranylcypromine. That and the fact that its expression is elevated in a number of cancers may make it a promising target for drug development.

- CELLESTIAL® Red Substrate allows real-time fluorometric or colorimetric detection
- Single-step, homogeneous assay ideal for high-throughput screening applications
- 1000 U of LSD1 supplied with each kit

#### High Sensitivity Assay for Measuring Demethylation Efficiency

#### Easily Detect Inhibitors of LSD1

Tranylcypromine Inhibition of LSD1. LSD1 enzyme (0.1 µg/µL) was incubated with the indicated concentrations of tranylcypromine for 30 minutes at room temperature (23°C). Samples (0.5 µg, 5 µL) were then transferred to wells for the demethylation assay with 20 µM H3K4Me2 peptide. Fluorescence was measured at 47 sec intervals on a CytoFluor™ II fluorescence plate reader (PerSeptive Biosystems, Ex. 530 nm, Em. 590 nm, Gain = 60).

### ELISA-Based Detection

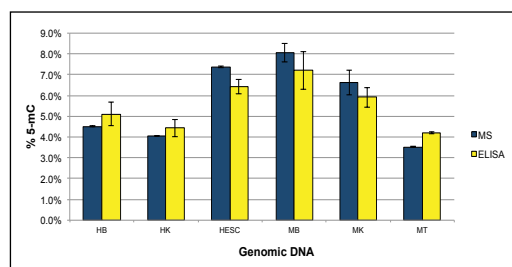

#### Convenient Kits for Sample Conversion & Detection

DNA methylation can alter gene expression and cell differentiation, often resulting in unidirectional changes to genomic DNA. Its involvement in so many cellular processes may lead to errors resulting in abnormal DNA methylation patterns which can lead to disease. Expanding our expertise in epigenetic modification analysis, Enzo Life Sciences now offers a portfolio of products that enable detection of DNA methylation which includes 5-Methylcytosine and 5-Hydroxymethylcytosine DNA ELISA kits.

#### 5-Methylcytosine DNA ELISA Kit (ADI-900-224)

- Accurately quantitate 5-mC in any DNA sample in < 3 hours
- Ideal for high-throughput analysis
- High specificity comparable to LC-MS/MS-MRM analysis

#### ELISA Results Closely Correlate to Mass Spectrometry Analysis

Genomic DNA Mass Spectrometry versus ELISA analysis: The 5-methylcytosine DNA ELISA kit (Prod. # ADI-900-224) quantifies 5-mC in numerous DNA samples with close correlation to LC-MS/MS-MRM analysis. Genomic DNA samples include: human brain (HB), human kidney (HK), human embryonic stem cell (HESC), mouse brain (MB), mouse kidney (MK), and mouse testes (MT).
